

Create backend for website by creating 3 files in include and index.php for the 1st page

server.php

[!NOTE] main page for backend , which means all the backend goes through here first may add more functions later

```
require 'settings.php';

require __DIR__ . '/../vendor/autoload.php';

$dotenv = Dotenv\Dotenv::createImmutable(__DIR__ . '/../..');
$dotenv->load();

require('database.php') ;
```

settings.php

[!NOTE] page for settings mainly used for timezone and managing base URL because in localhost it uses the same host for all web server

```
$is_local = ($_SERVER['HTTP_HOST'] === 'localhost');

// Set the correct base path

$basePath = $is_local ? 'SelamaTourism' : ''; // Local subfolder, empty for production
$basePath2 = $is_local ? '/SelamaTourism' : ''; // Local subfolder with slash, empty for production
$rootPath = $is_local ? '/SelamaTourism' : '';

date_default_timezone_set('Asia/Kuala_Lumpur');

require('database.php') ;
```

database.php

[!NOTE] page for managing connections with the database details (
password, username ,host, database name)

```
$conn = mysqli_connect($_ENV['host'], $_ENV['user'], $_ENV['pass'], $_ENV['database5']);  
  
if (!$conn) {  
  
    die("Connection failed: " . mysqli_connect_error());  
  
}
```
